

Abstract of the Disclosure

a A device for using a service that is made available in a telecommunications
a network. A user-side terminal (3) can be connected to at least one network server (1),
a and a control device (5) executes an interface program. The control device (5) is
a assigned to the terminal (3) and is used for controlling and operating the service. The
a 5 interface program, before the service is used, is transmitted by the network server (1)
a to the control device (5). Also provided is a method for using a service made
a available in a telecommunications network, the user interface being transmitted from
a the network server (1) to the control device (5) and being executed there.
